About Our Project

We created an app that provides convenient access to choosing and booking bus rides from city to city. In just a few minutes, you'll be able to find rides to the city you're looking for, choose the most convenient ride for you, and book immediately!

DEMO TIME!

What Did We Learn?

- How to connect MySQL databases to IntelliJ
- How to use JavaFX SceneBuilder
- Listening for events (mouse click, action event, etc)
- Working together on Github

Major Difficulties

- Figuring out JDBC between MySQL, IntelliJ, and Scene Builder
- Implementing a “back” button that returned the user to the previous page with the previous information still available
- Figuring out what our foreign/primary keys would be
- Couldn’t pull because different versions of Java

THANK YOU!
